

Hi, There are 2 assignments.

1. Please check the di.js file and finish it
2. Build a chrome extension

Mockups for the extension:

The above mockup is the popup view of the extension, you might need some data, here is the endpoint for you:

GET <https://api.bonusway.com/campaigns?limit=10&offset=0> (need to request with header: "accept-language: ru")

You will get an array of item, you need to use the data inside the item to show the information in the list above, the data field already marked inside the mockup, image.url means you will need the data from image.url field and title as well.

Requirements:

- The name of the extension called: kopikot.
- The default extension you can find inside the folder named: 'default.png'.
- When users visit <https://kopikot.ru> and these users have already installed this extension, the icon should change to active.png'.
- When users open the extension, the popup view will list the first 10 items (showed in the mockup above)
- When users click 'load more' button, the extension will load more items and append these new items at the end of the list.
- When users click the image or title, the extension should open a new tab (the url can always be: <https://kopikot.ru>)
- The extension should be able to track how many clicks the user has done, when the total click number is over 10, then the extension should show a notification said: "you can not click more".
- You need to consider i18n, the above text: "you can not click more" can not be hard-coded in the code, you can create two locales: "en" and "ru".

- The extension should be implemented using angularJS or angular.
- You can do whatever CSS styles you want, ugly looking is not a problem only if the functionalities are there.
- Please create a git repository and work inside it.
- Please submit your extension code to github or bitbucket or anywhere you like and give us the link that we can go and have a look.
